

**Workshop course content & syllabus**  
**'Political ecology, degrowth, and the Green New Deal'**  
*Summer Academy for Pluralist Economics 2022*

**Course content**

The first day of the workshop is intended to initiate students to the foundational concepts of ecological economics. Ecological economics is an ecological critique of economics, applying the energetics of life to the study of the economy. It also investigates the social distribution of environmental costs and benefits. It does so by deconstructing concepts that are taken for granted like “nature” or “the economy”, excavating their ideological origins.

After laying these foundations, on the second day of the workshop we will venture into the theory of degrowth. Degrowth is, first, a critique of the ecological consequences of economic growth. The faster we produce and consume goods, the more we transform and damage the environment. Second, economic growth is no longer desirable. The costs of growth exceed its benefits. Growth has become by now “uneconomic”.

Thirdly, growth has always been based on exploitation. Without a surplus, there is no investment and no growth. To have a surplus, capitalists or governments must exploit someone, somewhere.

The question on everybody's mind at this point will probably be: what would a degrowth economy look like? On the third day of the workshop, we will look at some of the flagship policy proposals articulated by degrowth scholars. These policy proposals are an attempt at reforming the institutions of property, work, and money to ensure social inclusion, economic equality, and ecological sustainability.

On the final day of the workshop, we will engage with the emerging political discourse of the Green New Deal. This discourse postulates the need for an active role of the State in the economy to drive the ecological transition. To do so, Green New Deal advocates aim at deploying the power of public investment and coordination is a historic break from neoliberalism. However, for this discourse to be up to the task of staving off the mounting global ecological breakdown, the theoretical and policy insights provided by degrowth must be incorporated for a socio-ecological transformation.
